

About

Gulp is a helpful tool that I have been using to automate some tasks in the development workflow. As of now, I have it automating the compilation and minification of SCSS files.

Getting Started

To get started with Gulp you will need to have it installed. Make sure you have Node.js installed so that we can use the Node Package Manager (NPM) to install our dependencies.

Installing Gulp

This will install Gulp globally on your system and allow you to start using the gulp commands.

```
$ npm install gulp-cli -g
$ npm install gulp -D
```

Running Gulp

Running Gulp is simple. In our setup you can simply run:

```
$ gulp
```

Which will run the default Gulp task specified in *gulpfile.js*. However, if you want to run specific tasks then you can do:

```
$ gulp <name of task>
```

NOTE: Make sure you are in the directory *Whiti.com/Deployment_2/Flask_Server/*.
