## Access the website

Once you are running the server you can navigate to the website via a browser. To do this on the same computer as the server, go to the URL 'https://localhost:5000'. If you are on a separate device, replace 'localhost' with the IP address of the computer running the server (you can Google "ip address" to find this).

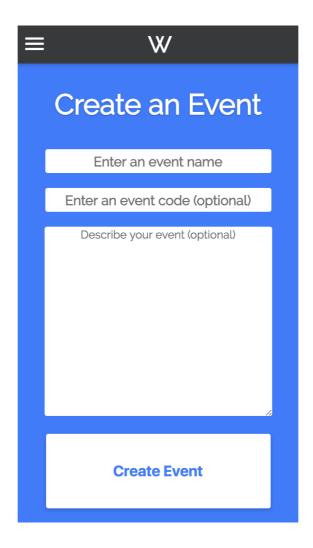

Your message will show a warning mentioning that the website is unsafe. This is simply due to using an uncertified certificate; once deployed on a public server with a proper certificate this should no longer happen. Until then, you can ignore this warning:

- \* In Chrome, click 'Advanced' and then the "Proceed to" link.
- \* In Firefox, click 'Advanced', 'Add Exception', then 'Confirm Security Exception'.

## Create an event<a name="create-an-event"></a>

To create an event in Whiti, navigate to the 'Create Event' page.

Enter in an optional event title and description that will be displayed on the event page, then press 'Create Event'.

You will be taken to a new page which displays your unique event code. Make sure to share this with your users so that they can join the event.

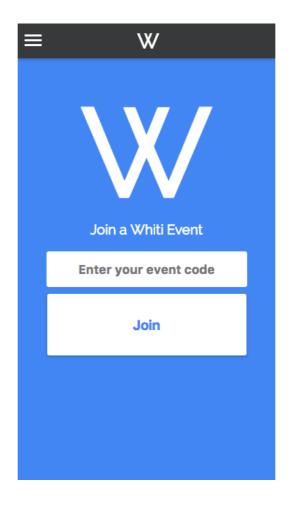

## Join an event<a name="join-an-event"></a>

Your first action is to choose whether you are joining the event as a listener or an intepreter. If you are wanting to hear the interpretation then join as a 'Listener'. If you will be interpreting the speaker at the event, then pick 'Interpreter'.

You should now be taken to a page that prompts you to enter an event code. One should be provided at the event, please enter this into the provided text field and press 'Join'.

If you joined the event as an interpreter, you will now be able to broadcast your interpretation to the listeners by speaking into your device's mic.

If you joined the event as a listener, you will now be able to receive audio from the interpreter.
